

Best protection against COVID-19 transmission : Avoidance of infected droplet

KEEP 2 METERS OF DISTANCE AT ALL TIME

Viruses can be transmitted in different ways. However, the following applies to the COVID-19 pandemic ("corona virus pandemic"): The most important transmission method is through very fine droplets, which every person brings into their surroundings when breathing out and speaking. The viruses "swim" in these fine droplets, which are not visible to the eye.

Fortunately these droplets fall rapidly under the force of gravity and stay on the ground and surfaces. This is why it is so important that we stay at a distance of at least two meters from other people. This way the droplets of the person facing us will not land on our face unnoticed.
